

My hepatitis C was cured. Does this mean I'm not at risk for liver cancer?

April 23, 2019 By [Lucinda K. Porter RN](#)

It depends on how severely damaged your liver is. If you had little or no fibrosis (Stage F0 to F2) and your hep C was cured, your risk for developing a type of liver cancer known as hepatocellular carcinoma (HCC) is the same as if you never have hepatitis C.

If you have cirrhosis or near-cirrhosis (Stage F3 or F4), you are at increased risk for developing HCC. Your hep C is gone, but the severity of your liver disease is the reason for your increased HCC risk. If this is your situation, [click here](#) to read the latest follow-up recommendations and discuss these with your liver specialist.
