

Prostate Cancer, Day 5,502 – PSA Results

Blogger Dan Zeller reviews his latest level of prostate-specific antigen (the measurement of a specific protein in the blood).

December 8, 2025 By [Dan Zeller](#)

It's that time again. My PSA came back at 1.57 ng/mL, up from 1.34 ng/mL in September.

PSA doubling time using the last five values increased slightly from 11.5 months in September to 11.9 months now. PSA Velocity went from 0.6 to 0.8 ng/mL/yr.

Dan Zeller

My appointment to review the results is on 30 December 2025, and I'll be sure to talk about another PSMA PET scan to see if we can determine what's going on before we start down the androgen deprivation (hormone) therapy path.

On an unrelated note, I managed to take a little drive through the country from San Diego to visit family in southeastern Wisconsin and back last month. You can check out the full story [HERE](#) if you're bored.
